

**Claims:**

- 1        1. A method of optically converting a digital signal to an analog signal, by  
2 employing a conversion module, comprising the steps of:
  - 3            receiving a predetermined optical signal;
  - 4            splitting the received optical signal into a plurality of mutually coherent  
5 optical beams;
  - 6            supplying said plurality of optical beams on a one-to-one basis to a  
7 corresponding plurality of optical phase shifters;
  - 8            supplying bits of a digital data sequence to said plurality of optical phase  
9 shifters for controlling the phase shift of the optical beams supplied to the individual  
10 ones of said plurality of phase shifters;
  - 11          supplying said phase shifted optical beams to a combiner for recombining  
12 mutually coherent phase shifted optical beams; and
  - 13          said combined mutually coherent phase shifted optical beams representing an  
14 optically converted digital-to-analog optical signal.
- 1        2. The method as defined in claim 1 wherein said plurality of optical phase  
2 shifters includes at least two (2) optical phase shifters.
- 1        3. The method as defined in claim 1 wherein said plurality of optical phase  
2 shifters includes at least four (4) optical phase shifters.
- 1        4. The method as defined in claim 1 wherein said plurality of optical phase  
2 shifters includes at least eight (8) optical phase shifters.
- 1        5. The method as defined in claim 2 further including a step of generating a  
2 laser optical signal.
- 1        6. The method as defined in claim 5 wherein said step of generating said laser  
2 optical signal includes generating a continuous wave optical signal.
- 1        7. The method as defined in claim 5 wherein said step of generating said laser  
2 optical signal includes generating a pulsed optical signal.
- 1        8. The method as defined in claim 6 further including a photodiode for  
2 detecting said recombined optical signal representing said optically converted digital-  
3 to-analog optical signal.
- 1        9. The method as defined in claims 8 wherein in response to said recombined  
2 mutually coherent optical signals said photodiode develops current  $i_{PD}$  as follows:

$$3 \quad i_{PD} = RP_m \left| \sum_i \exp \left( j\pi \frac{V_i}{V_\pi} \right) \right|^2,$$

4 where  $i_{PD}$  is the photodiode current,  $R$  is the responsivity of the photodiode,  $P_{in}$  is he  
 5 launched optical power,  $V_i$  is the control voltage for the  $i$ -th optical phase shift  
 6 modulator developed in response to said bits of said digital data sequence and  $V_\pi$  is  
 7 the switching voltage for an optical phase shift modulator.

1        10. The method as defined in claim 9 further including configuring each of  
 2 said control voltages  $V_i$  so that each has two voltage levels,  $V_{i,low}$  and  $V_{i,hi}$ , thereby  
 3 generating  $2^i$  output current  $i_{PD}$  levels.

1        11. The method as defined in claim 10 further including switching said  
 2 control voltage levels at a predetermined rate for generating an arbitrary waveform at  
 3 an output of said photodiode.

1        12. The method as defined in claim 7 further including controlling said pulsed  
 2 laser optical signal to have the same repetition rate as bits being supplied from a  
 3 memory unit to control the phase shift of each of said optical phase shifters.

1        13. The method as defined in claim 12 further including a photodiode for  
 2 detecting said recombined optical signal representing said optically converted digital-  
 3 to-analog optical signal, and wherein in response to said recombined mutually  
 4 coherent optical signals said photodiode develops current  $i_{PD}$  as follows:

$$5 \quad i_{PD} = RP_m \left| \sum_i \exp \left( j\pi \frac{V_i}{V_\pi} \right) \right|^2,$$

6 where  $i_{PD}$  is the photodiode current,  $R$  is the responsivity of the photodiode,  $P_{in}$  is he  
 7 launched optical power,  $V_i$  is the control voltage for the  $i$ -th optical phase shift  
 8 modulator developed in response to said bits of said digital data sequence and  $V_\pi$  is  
 9 the switching voltage for an optical phase shift modulator.

1        14. The method as defined in claim 13 further including configuring each of  
 2 said control voltages  $V_i$  so that each has two voltage levels,  $V_{i,low}$  and  $V_{i,hi}$ , thereby  
 3 generating  $2^i$  output current  $i_{PD}$  levels.

1        15. The method as defined in claim 14 further including switching said  
 2 control voltage levels at a predetermined rate for generating an arbitrary waveform at  
 3 an output of said photodiode.

1        16. The method as defined in claim 6 further including cascading a plurality  
 2 of said conversion modules each including a predetermined plurality of optical phase  
 3 shifters for generating said converted digital-to-analog optical signal.

1        17. The method as defined in claim 16 further including a photodiode for  
 2 detecting said optically converted digital-to-analog optical signal.

1        18. The method as defined in claims 17 wherein in response to said  
 2 recombined mutually coherent optical signals said photodiode develops current  $i_{PD}$   
 3 as follows:

$$4 \quad i_{PD} = RP_m \prod_j \left| \sum_i \exp\left(j\pi \frac{V_{i,j}}{V_\pi}\right) \right|^2,$$

5 where  $j$  is the running index for the  $j$ -th stage,  $i_{PD}$  is the photodiode current,  $R$  is the  
 6 responsivity of the photodiode,  $P_m$  is the launched optical power,  $V_{ij}$  is the control  
 7 voltage for the  $i$ -th optical phase shift modulator in the  $j$ -th stage developed in  
 8 response to said bits of said digital data sequence and  $V_\pi$  is the switching voltage for  
 9 an optical phase shift modulator.

1        19. The method as defined in claim 18 further including configuring each of  
 2 said control voltages  $V_{ij}$  so that each has two voltage levels,  $V_{ij,low}$  and  $V_{ij,hi}$ , thereby  
 3 generating  $2^j$  output current  $i_{PD}$  levels.

1        20. The method as defined in claim 19 further including switching said  
 2 control voltage levels at a predetermined rate for generating an arbitrary waveform at  
 3 an output of said photodiode.

1        15. The method as defined in claim 14 further including switching said  
 2 control voltage levels at a predetermined rate for generating an arbitrary waveform at  
 3 an output of said photodiode.

1        16. The method as defined in claim 6 further including cascading a plurality  
 2 of said conversion modules each including a predetermined plurality of optical phase  
 3 shifters for generating said converted digital-to-analog optical signal.

1        17. The method as defined in claim 16 further including a photodiode for  
 2 detecting said optically converted digital-to-analog optical signal.

1        18. The method as defined in claims 17 wherein in response to said  
 2 recombined mutually coherent optical signals said photodiode develops current  $i_{PD}$   
 3 as follows:

$$4 \quad i_{PD} = RP_m \prod_j \left| \sum_i \exp\left(j\pi \frac{V_{i,j}}{V_\pi}\right) \right|^2,$$

5 where  $j$  is the running index for the  $j$ -th stage,  $i_{PD}$  is the photodiode current,  $R$  is the  
 6 responsivity of the photodiode,  $P_m$  is the launched optical power,  $V_{ij}$  is the control  
 7 voltage for the  $i$ -th optical phase shift modulator in the  $j$ -th stage developed in  
 8 response to said bits of said digital data sequence and  $V_\pi$  is the switching voltage for  
 9 an optical phase shift modulator.

1        19. The method as defined in claim 18 further including configuring each of  
 2 said control voltages  $V_{ij}$  so that each has two voltage levels,  $V_{ij,low}$  and  $V_{ij,hi}$ , thereby  
 3 generating  $2^j$  output current  $i_{PD}$  levels.

1        20. The method as defined in claim 19 further including switching said  
 2 control voltage levels at a predetermined rate for generating an arbitrary waveform at  
 3 an output of said photodiode.
